Build me a reminder web application with a view to further make it into a mobile application for Android and iOS. The name of the app is Yere — Remember the times, together!

Primary product reference:
Use Any.do web app (https://app.any.do/tasks/all) and its Android/iOS mobile apps as the main reference for how the product should work, feel, and be organised. Study and adapt its UX patterns: onboarding, My Day, Next 7 Days, All Tasks, custom lists, quick-add, natural-language date/time parsing, voice capture, reminders, recurring tasks, notes/attachments, sharing/collaboration, calendar integration, notifications, settings, themes, gestures, bottom navigation on mobile, floating add button, swipe actions, empty states, loading skeletons, and cross-device sync. Use Any.do as inspiration only — do not copy its branding, assets, or proprietary text. Adapt these patterns to Yere's trusted-contact reminder use case.

The GitHub repository is connected. Also attached is the UI/UX I designed in HTML. Use local Nigerian names to replace the names in the sample data in the attached UI. There is no logo yet, so design a simple placeholder logo that I will replace later.

Tech Stack, Hosting & Deployment

- Hosting: Use Vercel to host the web app as an installable PWA.
- Database/Backend: Use Supabase as the database and backend platform. Use Supabase for:
    1. Postgres database
    2. Authentication (email/password, sessions, password reset)
    3. Row Level Security (RLS)
    4. Edge Functions
    5. Storage for photos/attachments
    6. Realtime where useful
    7. `pg_cron` for scheduled reminder firing
- The web app must be a proper PWA: web manifest, service worker, offline shell, installable on mobile, push notification support where available, and "Add to Home Screen" support.
- Ensure secure environment variables, Supabase RLS policies, and Vercel deployment configuration are set up.
- Automatic deployment: Any update pushed to the connected GitHub repository must automatically reflect on the Vercel deployment. Configure this using

Vercel's Git integration so that pushes to the production branch trigger production deployments, and pull requests create preview deployments.

- Deliverable requirement: Provide a clear, step-by-step deployment and configuration guide, preferably as a `DEPLOYMENT.md` file in the repository, covering:
    1. Supabase setup: create project, configure Auth, run database migrations, create tables, enable RLS policies, create storage buckets, deploy Edge Functions, configure `pg_cron`, set secrets, and test notifications.
    2. Vercel setup: import the GitHub repository into Vercel, choose the correct framework preset, set build command, output directory, install command, and add all required environment variables.
    3. Automatic GitHub-to-Vercel deployment: explain how to connect the repo, set the production branch, enable preview deployments, verify that a GitHub push triggers a Vercel deployment automatically, and how to roll back if needed.
    4. PWA verification: confirm manifest, service worker, installability on iOS/Android, push notification behaviour, and theme switcher functionality.
    5. Troubleshooting: common issues with Supabase keys, RLS, Edge Functions, Vercel environment variables, build failures, and GitHub sync.
- List all required environment variables for local development and Vercel, such as Supabase URL, anon key, service role key, and any third-party email/SMS/push keys. Service role keys must never be exposed client-side.

MVP Features

Trusted & Approved Contacts

- Two approval paths; the user can choose either:
    1. Email/SMS invite: The user invites a trusted contact by entering their email address or phone number. The system sends a secure invite link via email or SMS. The contact accepts the invite and enters the approval flow.
    2. Single-use, 24-hour invite code: The user generates a single-use invite code that expires after 24 hours. The contact enters the code to request or accept approval.

- Email/SMS invite links/tokens should be secure, hashed server-side, rate-limited, and preferably single-use and expiring for safety, but they are a separate user-facing path from the manually shared invite code.
- Approval flow: pending, approved, revoked.
- Audit log for invites, approvals, revocations, and reminders set on behalf.
- Approved contacts can set reminders on behalf.
- Recipient sees a “From [Contact]” badge and can edit/delete.
- Approval modes: direct set or require approval.
- Server-side security: hashed codes/tokens, rate limits, block list, auto-suspend.

Capture Anything (Text & Voice)

- Quick-add text field with natural-language date/time parsing, inspired by Any.do’s quick-add.
- Defaults to 9:00 AM local time if no time is given.
- Voice input using native speech recognition (iOS, Android, Web).
- Confirmation card before saving.
- Any.do-style quick date/time chips, repeat options, list/category selection, and reminder channel selection.

Recurrence That Adapts

- Standard intervals: minutes, hours, days, weeks, months, years.
- Presets and end conditions: never, after N, on date.
- Calendar-aware patterns: first/last day of month, nth weekday.
- Adaptive recurrence: next occurrence based on completion date or original due date.
- Smart skip, weekend/holiday avoidance, future pattern learning.

Remember the “Why”

- Notes and optional link on every reminder.
- Searchable notes, visible on cards/detail views.

Reminders Core

- Exact due date/time, quick buttons, types: repeating, expiry, renewal.
- Notes, cost, photo, categories/colors, delivery channel: email/push/both.
- Any.do-inspired task detail view with notes, attachments, subtasks if useful, and activity/history.

List & Daily Use

- Grouped by Due now / Today / This week / Later.
- Any.do-inspired views: My Day, Next 7 Days, All Tasks, custom lists/categories, and calendar view.
- Live labels, Done list with Undo, Snooze options.
- Swipe actions, drag-and-drop reordering, quick-complete, bottom navigation on mobile, floating add button.
- Friendly empty states, loading skeletons, plain-language errors.

Notifications

- Per-minute `pg_cron` job calling a Supabase Edge Function.
- Idempotent `reminder_fires` table.
- Action buttons on Android/desktop; iPhone opens snooze screen.
- Settings: push toggle, test notification, permission instructions.
- Any.do-style notification and reminder behaviour where appropriate.

Accounts

- Email/password sign-up and sign-in using Supabase Auth.
- Persistent sessions, forgot password, iPhone Safari “Add to Home Screen” banner.
- Any.do-inspired onboarding and cross-device sync expectations.

UI/UX, Branding, Responsiveness & Themes

- Use the attached HTML UI/UX as the starting point.
- Replace sample data names with local Nigerian names such as Amina, Chinedu, Ngozi, Tunde, Aisha, Emeka, Fatima, Bola, Yusuf, Chioma, etc.

- Design a simple placeholder logo for Yere — Remember the times, together! Suggested concept: a warm, trustworthy mark combining a clock, checkmark, or people-together symbol. Deliver as SVG and favicon. It will be replaced later.
- Overall feel: clean, calm, fast, mobile-first, and similar in usability quality to Any.do, but tailored to trusted reminders set by and for people who care about each other.
- The entire app must be highly responsive — it should adapt fluidly to all screen sizes: mobile phones, tablets, laptops, and desktops. Use responsive layouts, flexible grids, fluid typography, and touch-friendly controls. Test across breakpoints and ensure no horizontal scrolling, overlapping elements, or broken layouts.
- Dark and Light Theme Switcher:
    - Include a theme switcher that allows the user to toggle between dark and light themes.
    - Dark theme must be the default on first load.
    - The switcher should be easily accessible from the settings page and/or a quick toggle in the header or navigation.
    - Persist the user's theme preference (e.g., in `localStorage` and, if authenticated, optionally in the user's Supabase profile) so it is remembered across sessions and devices.
    - Ensure all UI components, including the animated sprite pages, are fully styled and legible in both themes.
    - Respect the user's system preference only if they have not explicitly chosen a theme, but default to dark when no preference is set.

Animated Sprite Feature Pages

- Create beautifully designed, animated sprite pages that highlight each major feature of the app.
- Each page should feature an animated sprite (e.g., a friendly character, icon, or illustrated element) that demonstrates the feature in a playful, engaging way.
- These pages should be part of the onboarding experience or a feature tour, guiding the user through what Yere can do.
- The animations should be smooth, lightweight, and performant. Use CSS animations, SVG animation, or a lightweight animation library (e.g., Lottie) that works well on mobile and web.
- The sprite pages must be fully responsive, scaling gracefully from small phones to large desktop screens, and must look great in both dark and light themes.

- Each page should have a clear headline, short supporting text, and a visual that reinforces the feature (e.g., trusted contacts, voice capture, adaptive recurrence, notes, notifications).
- Ensure the animations do not block interaction, and provide a way to skip or navigate through the feature tour.

Deployment & Automation Summary

- Deploy the web app as a PWA on Vercel, with Supabase as the database/backend.
- Include complete step-by-step instructions for deploying on Vercel, configuring Supabase, and setting up automatic GitHub-to-Vercel deployments so that every update pushed to GitHub is reflected automatically on the live Vercel deployment.
- The animated sprite feature pages must be included in the build and work correctly after deployment.
- Ensure the final deployed app is fully responsive, passes PWA installability checks, and correctly defaults to the dark theme with a working light/dark switcher.
-
